internet service providers isps can exploit path diversity to balance load and improve robustness unfortunately it is difficult to evaluate the potential impact of these approaches without routing and topological data which are confidential in this paper we characterize path diversity in the real sprint network we then characterize path diversity in isp topologies inferred using the rocketfuel tool comparing the real sprint topology to the one inferred by rocketfuel we find that the rocketfuel topology has significantly higher apparent path diversity as a metric path diversity is particularly sensitive to the presence of false or missing links both of which are artifacts of active measurement techniques we evaluate heuristics that improve the accuracy of the inferred rocketfuel topologies finally we discuss limitations of active measurements techniques to capture topological properties such as path diversity
